TEXAS

Sea Rim State Park Coastal Dune Restoration

This project restores 5.3 miles of dune habitat by planting native dune vegetation to accelerate natural dune recovery. Planting dune grass will provide immediate benefits to wildlife often seen using dune habitat at the park, including mottled ducks, marsh hawks and merlins. The project includes post-construction monitoring to determine project effectiveness. A similar project has been successfully completed at Galveston Island State Park. Sea Rim State Park is located in Jefferson County approximately 20 miles south of Port Arthur. The dune system along this stretch of the Upper Coast of Texas has been severely eroded due to the passage of several severe storms. The lack of an effective dune system increases the frequency of salt water intrusion into the coastal marsh behind the beach and has accelerated its erosion.

Restoring the integrity of the dune system is a major objective of the recently published Salt Bayou Watershed Plan, which was prepared by an interagency working group and includes Sea Rim State Park, McFaddin National Wildlife Refuge and the J.D. Murphree Wildlife Management Area, is the largest contiguous expanse of coastal marsh in Texas. The U.S. Fish and Wildlife Service is currently evaluating a complimentary dune restoration project in McFaddin National Wildlife Refuge immediately west of this project. This complex coastal system provides high quality habitat for several bird species affected by the spill, and also provides critical storm buffering for the Port Arthur area.

The Gulf Environmental Benefit Fund, administered by the National Fish and Wildlife Foundation (NFWF), supports projects to remedy harm and eliminate or reduce the risk of harm to Gulf Coast natural resources affected by the 2010 Deepwater Horizon oil spill.
